Class 8 — Practice Class

Conditions & Loops — Beginner Level

These problems use only what has been covered so far: variables, operators, input(), if / elif / else, for loop, while loop, break, and continue. Solve them live in class.

Q1. Even or Odd

Take a number as input from the user and print whether it is Even or Odd.

Q2. Sum of Natural Numbers

Take a number n as input and print the sum of all natural numbers from 1 to n using a loop.

Try it with both a for loop and a while loop.

Q3. Multiplication Table

Take a number as input and print its multiplication table from 1 to 10 using a for loop.

Q4. Count Digits

Take a number as input and count how many digits it has using a while loop.

Hint: keep dividing the number by 10 until it becomes 0.

Q5. Reverse a Number

Take a number as input and print it in reverse using a while loop (do not use string slicing).

Q6. Find the Largest of Three Numbers

Take three numbers as input and print the largest one using if / elif / else.

Q7. Simple Password Check

Ask the user to enter a password. Keep asking (using a while loop) until they enter the correct password, which is "python123". Print "Access Granted" once correct.

Q8. Print All Even Numbers in a Range

Take a start and end number as input, then print all even numbers between them using a for loop.

Q9. Count Vowels in a Word

Take a word as input and count how many vowels (a, e, i, o, u) it contains using a for loop.

Loop through each letter and check with if.

Q10. Number Guessing (Fixed Number)

Set a fixed secret number in your code, for example 7. Ask the user to guess it repeatedly using a while loop. If the guess is too high, print "Too High"; if too low, print "Too Low"; stop the loop and print "Correct!" when they guess it.
